

- **Which pages should be accessible for each of those groups?**

I think for both instructors and students, they should be allowed to access to each page's, they can have the right to view each page's detail, like how many course we have and which semester we have. But they are not allowed to create, delete or change things on those pages, those functions should be hidden from them.

- **Do we need to consider the extent to which the content on the page refers to them or to other people?**

Yes, I think we need to take that into consideration. Because we don't want other people's information to be shown to every single person. I think its ok for student users to see how many course, students, semesters...etc. we have. But showing them other students' course choices or something like that is not a good choice.

- **Are there particular fields or fields on the page which should be made inaccessible?**

In my opinion, create, delete and change functionality should be made inaccessible except for the superuser and special users like scheduler.

- **How might these features impact the code in the views.py portion of the Django app?**

While I still don't know much about Django, in my case we might need some authorization parts like if-else clauses to help us display content differently for different types of users.
